

Roofing Report

Farmers' Almanac Winter Prediction Will Impact Flat Roofs

Even with advanced technologies in predicting weather, many still look to the tried and true Farmers' Almanac for an outlook on the weather since their accuracy has been long-standing. Their projection for the Midwest's coming winter is a combination of colder than normal temperatures and above average snow amounts.

This means it's more important than ever to assure your flat roof is ready.

1

REMOVE DEBRIS

With our early snowfall, leaves didn't have a chance to be cleared. Take time to remove branches, leaves, and other debris both from the roof surface and drains.

2

CHECK FOR LEAKS

Walk the entire surface to visually inspect looking particularly for sagging, puddled water, cracks and places the roof isn't secure to walls or protrusions.

3

WATCH FOR MOLD

Mold, mildew, and algae can conceal underlying roof issues. Clean and remove any of these.

4

ICE DAMS AND SNOW REMOVAL

As we get into winter, watch for icicles which may signal ice dams. Ice can be especially damaging to a membrane. Experts note that packed snow in excess of a foot can cause damage to your roof so safely remove it.

Roof Work Continues Year Round

While the predictions are for a challenging coming winter, our dedicated team at Precision braves all weather extremes and completes commercial and industrial flat roof projects all year. With Wisconsin's unemployment rate at 3%, you can likely identify with the challenges of finding qualified employees. So, if you are someone looking for a job, we want to hear from you. Or, if you are considering having us install your roof, we appreciate advance notice to assure we can staff accordingly.

RESTAURANTS HAVE CHALLENGING ROOF DEMANDS

The combination of heat mixed with grease remnants from exhaust systems for stoves, ovens, and grills is one of the major factors that make a PVC flat roof system the ideal choice for restaurants. Additionally, fumes and oil can cause wear on the seams, and vented grease can attract rodents and insects.

Our team has expertly installed millions of feet of Duro-Last membranes on restaurants with a great success rate of both the material and installation withstanding the rigorous demands of these roofs. Recently we've installed many roofs on newly constructed restaurants. We also specialize in removal and reroof for existing restaurants. Be assured that if you are looking to install a restaurant, or other commercial or industrial flat roof, that we are a great choice.
