

Like buying a car or selecting all the pieces for a great outfit,
**when considering a roof, there are lots
 of accessories to choose from.**

The Duro-Last membranes our team installs have coordinating components that allow us to custom design the roof system that is best suited to your building. A major benefit is that accessories are custom pre-fabricated so our “time on the roof” for installation is the most efficient.

FOUR OF THE MOST COMMON ACCESSORIES ARE:

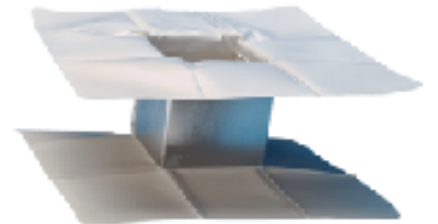

EDGE METALS

These vinyl-coated metal pieces ensure a water-tight, durable bond between the membrane and edge detailing as well as are used for terminations. Available in 23 colors, including premium metallics, they offer superior color retention to create a stunning visual from the street view.

SCUPPERS

Primary scuppers channel water to a conductor box, downspout or gutter; while overflow scuppers let water run freely down the side of the building.

They are constructed of metal with the membrane already welded on which reduces installation time and creates a clean, attractive finish. This unique construction ensures a long-lasting, watertight flashing.

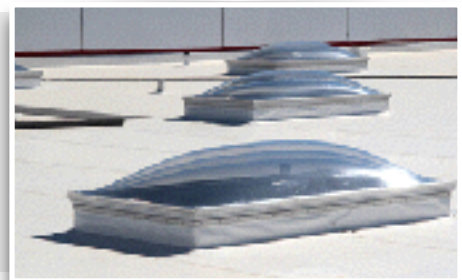

CUSTOM STACKS

Round penetrations are common on rooftops and custom prefabricated stacks easily wrap around them. The flashing's skirt is hot welded to the installed membrane to ensure a long-lasting, watertight system.

SKYLIGHTS

Add lighting and thermal performance with skylights. The selection of elements is virtually limitless: curb or deck mount; high density acrylic or polycarbonate lenses; single, double, or triple dome construction; and rounded dome or pyramid. Every skylight unit is fully assembled with high-performance weather seals for air and water resistance.
